1. Introduction

1.1. Instruction

Aqua Terra Consultants Ltd (Aqua Terra) was instructed by RSK Environment Ltd (RSK; the Client) on behalf of Foel Fach Wind Farm Limited (the Applicant) to provide an Outline Soil Management Plan (OSMP) for a proposed wind farm approximately 3.1 km north-east of Bala, Wales (the Site), comprising wind turbines, and a battery energy storage system (BESS). The project is to be referred to as Foel Fach Wind Farm ('the Proposed Development').

1.2. Brief

RSK has compiled an Environmental Statement (ES) on behalf of the Applicant to accompany an application for planning permission for the Proposed Development at the Site. The Site is located on grazing moorland east of the Eryri/Snowdonia National park boundary, the nearest settlement is the village of Frongoch located south-west of the Site boundary.

The Proposed Development comprises:

- 10 No. three bladed horizontal axis wind turbines
- wind turbine foundations and hardstanding areas which will include crane pad hardstanding areas and laydown/storage areas
- an onsite substation
- a battery energy storage system (BESS)
- permanent wind monitoring equipment (LiDAR)
- site access improvements, through the upgrading of the existing junction off the B4501
- onsite access tracks (new roads and upgraded existing roads/tracks), passing places and vehicle turning heads
- underground power cables linking the wind turbines and the substation
- watercourse crossings and associated infrastructure
- drainage systems
- micrositing up to 50 m
- onsite signage, and
- biodiversity enhancements proposals.

In addition to the above, the following temporary components, integral to the Proposed Development, are proposed during the construction phase:

- temporary construction and storage compound, located along the Site access track
- temporary working area north of the tracks leading to T09 and T10
- temporary concrete batching compound
- up to five temporary materials/ soil storage areas (if required)
- temporary peat storage area, and
- temporary borrow pit for the extraction of stone.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

As part of the preparations for submission of permission to undertake the development under the Developments of National Significance (DNS) process, a Scoping Direction (**ES Volume III, Appendix 1.2: EIA Scoping Direction and Addendum**) has been provided by PEDW in relation to the Proposed Development. This included a formal consultation undertaken with Welsh Government Soil, Peatland & Agricultural Planning Unit (also known as the Land Quality Advice Service (LQAS)). The LQAS consultation response is as follows:

> *"The applicant's attention is drawn to comments from LQAS stating a soil management scheme should be prepared. LQAS adds this should set out how all soils and their functions will be conserved and reinstated at decommissioning. LQAS in their response provide further detail on the requirement for the scheme. PEDW recommends this is included as a technical appendix to the ES"*
>
> *"Soil Management Scheme*
>
> *A soil management scheme should be prepared by the developer, informed by a baseline soil resources and physical characteristics report, and be considered as part of the ES process. This should be a clear scheme and programme setting out how all soils and their functions will be conserved and reinstated at decommissioning. The Scheme should be presented in sufficient detail for the determining authority and statutory consultees to form a judgement as to its feasibility, and should include: -*
>
> - *Soil stripping programme - volumes and types of soils affected;*
> - *Soil handling techniques and procedure;*
> - *Size, location, construction, management and period of soil storage dumps;*
> - *Proposed after use and restoration programme, including techniques and aftercare programme.*
>
> *A detailed scheme will support the ES process in considering: -*
>
> - *Reasonable alternatives considered for the proposal;*
> - *Potential impacts of the development and demonstrate how the proposal will not have an unacceptable adverse impact on the environment (in this case the peatland and soils resource);*
> - *The feasibility and how effective restoration and beneficial after use can be achieved;*
> - *How the proposal will maintain the resilience of national natural resources and avoid the loss of function and services provided by the peatlands and soils".*

This OSMP has been written to address these requirements. It has been prepared as an appendix to the ES Chapter on Land, soils, and water (**ES Volume II, Chapter 7: Land, Soils and Water**).

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

1.4. Regulatory Context

This OSMP is based upon the following policy and guidance documents:

- Minerals Technical Advice Note (MTAN) 1 (Aggregates), Welsh Government[1]
- Construction Code of Practice for the Sustainable Use of Soils on Construction Sites, Department for Environment, Food and Rural Affair's (Defra)[2]
- Good Practise for handling soils, Ministry of Agriculture, Fisheries and Food[3]
- Environmental good practice on site guide (fourth edition). CIRIA Report No. 741, 2015
- Planning Policy Wales (PPW) Chapter 6[4]

The publication of the updated chapter 6 of PPW in October 2023 (then subsequently incorporated into Edition 12 in February 2024) represents the most recent update to planning policy with regards to soils. It references the seven goals of the Well-being of Future Generations Act, listing protection of soils as one of the aspects underlying the Resilient Wales goal. It provides the goal of Distinctive and Natural outcomes, and lists soil compaction and sealing, and soil carbon management as underpinning such outcomes.

Chapter 6 of PPW has some significant policy wording with reference to soils, the most salient of which have been drawn out and listed below:

- Paragraph 6.4.3 requires that development proposals must consider the need to safeguard soil, including peat soils.
- Paragraph 6.4.15 describes the step-wise approach to maintaining and enhancing diversity. Step 1 requires avoidance of habitats which are irreplaceable, and provides examples of which include "*peatland*" and "*long undisturbed soils"*. It states that proposals within these habitats are, "*as a matter of principle unacceptable"* and "*it will be wholly exceptional for development to be justifiable in such instances"*.
- Paragraph 6.4.34 describes that where peat is identified within Proposed Developments considerable weighting shall be given to its protection, and "*unless other significant material considerations indicate otherwise it will be necessary to refuse permission*."

1.5. Scope

The main body of this document considers all soils except peat. Peat has been subject to assessment in a separate Peat Management Plan (**ES Volume III, Appendix 7.4: Peat Management Plan**).

The scope of this document has been defined in order to meet the requirements set out in recent Soil Peatland and Agricultural Land Use Planning Unit (SPALUPU) Scoping Direction responses. It has also been drafted cognisant of the policy set out in Chapter 6 of PPW.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

Section 2 describes the soils present within the Site, as identified by a combination of desk-based study and fieldwork. This includes the categorisation of soils with respect to their potential status as *"long undisturbed soils"*.

Section 3 explains the step-wise approach taken to the design of the development with respect to soils, as one of the many environmental constraints and considerations.

Section 4 provides the soil stripping programme, which describes and quantifies the volumes and types of soils affected.

Section 5 sets out the measures that shall be employed to protect soils during the construction and decommissioning phases of the development, minimising and mitigating the impact that the development has on soils. This includes the requirements that shall be adhered to in the stockpiling of soils.

1.6. Limitations

This report relies in part on data collated from publicly available datasets and data sources, and from data collected on the Site by other parties. Aqua Terra has deployed reasonable skill and care in the collation and assessment of these data, and provides comment on such data where considered necessary. However, Aqua Terra takes no responsibility for the veracity or accuracy of data gathered from external sources.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

2. Soil Resource Baseline

2.1. Context

Soil is considered to be defined as the upper layer of the earth's crust in which plants grow. It is essentially a non-renewable resource as it may take more than 500 years to form a 2 cm thickness of topsoil (the most productive soil layer). The layers of soil are separated into horizons identified by their significant characteristics up to, usually a maximum of, 1.2 m depth.

The most significant threats to soil in Wales[5] vary depending on the land use, but these include:

- Climate change
- Soil compaction
- Soil erosion
- Loss of organic matter in soil, and
- Contamination of soil.

Most Welsh soils are considered at a low risk for degradation under their current agricultural management (85% of land in Wales is agricultural). The main threat is heavy machinery causing soil compaction. Therefore, the use of heavy machinery during construction of the Proposed Development must be carefully managed.

Onsite, the soil resource includes peat soils which are highly organic, highly fragile carbon traps. Peat stores between 20-25% of all Welsh soil carbon and thus is significant in addressing the Nature and Climate Change Emergencies in Wales and The Net Zero Plan for Wales.

Peat soils are considered separately in the Peat Management Plan (see technical appendices of **ES Volume II, Chapter 7: Land, Soils and Water**).

2.2. Published Soils Data

Soil types present onsite have been broadly defined using the data from Cranfield University's National Soils Map[6] as shown in **Figure 2-1** below.

The Hafren soil type covers the majority of Site, and underlies all of the planned turbine locations, with a smaller of Manod Soil type covering the access track and borrow pit and an area of Brickfield 1 in the West of the Site. Hafren is described as a "*very acid, loamy upland soils with a wet peaty surface*". These soils typically drain to a local stream network and mostly support rough grazing of low to moderate value. They are described as having a high carbon content.

The area of Manod soils along the access track and borrow pit area are described as "*freely draining acid loamy soils over rock*" and are shallow soils in places with bare rock locally found commonly on steep slopes typically used for stock rearing and woodland in uplands.

[5] Welsh Government **2019**, *Assessment of Welsh Soil Issues in Context,* Available at: https://www.gov.wales/sites/default/files/publications/2021-04/assessment-soil-issues-in-context_0.pdf

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

In the West of the Site the Brickfield 1 soil type is shown to be present, Brickfield 1 is an association of seasonally wet, slowly permeable, fine-textured surface-water gley soils, typically clay loam throughout, mainly used for stock-rearing on permanent grassland and wet moorland of moderate–good grazing value. For non-peat Brickfield ground, topsoil organic carbon is generally in the moderate range and provide potential for year-round grazing.

2.4. Peat and Soil Surveys

2.4.1. Survey Details

The peat soils onsite has been mapped by WRc (Part of the RSK Group) over two stages of peat probing, determining extent, depth and distribution of peat soils. The first stage comprised a 100 m grid of peat probes across the entire Site area. Stage 2 then comprised a detailed 10 m spacing across each proposed turbine location, and along all proposed trackways. Detailed soil data was not recorded during the peat surveys.

Aqua Terra undertook a soil survey at the Site in areas away from peat deposits comprising a 50 m grid survey targeting all proposed infrastructure. A total of 320 No. soil augers were completed.

2.4.2. Soil and Peat Thickness

The recorded depth of soil is shown in **Figure 2-2** and **Figure 2-3** which provide a plans of the interpolated soil thickness across the Site.

2.4.3. Soil Type

The soil descriptions collected by Aqua Terra during the fieldwork have been used to determine the distribution of basic soil types across the Site. The Site soils were typically classified as one of the following:

- **Loamy soils**: Clay loam was the dominant soil type in the lower western reaches of the Site and aligned well with the mapped Brickfield 1 soil type.
- **Organic mineral and peaty loam soil (Peaty Soils)**: This was encountered across the Site, and is the most prevalent soil type logged, typically in agreement with the soil mapping these soils were found across the majority of the upland area where the turbines are to be situated.
- **Sandy/stony soils**: This was separated from the loamy soils by the presence of sand and stones and by a lower organic content. It was typically found in the areas mapped as Manod soil type along the access track.
- **Peat soils**: Recorded in excess of 30 cm depth in several areas across the Site.

Figure 2-1 and **Figure 2-4** illustrates the distribution of the various soil types across the Site. As can be seen, there is a broad agreement with the published National Soils Map, in that the predominance of organic rich soil broadly follows the mapped Hafren soil type in the upland areas.

2.5. Long Undisturbed Soils

Chapter 6 of PPW places importance upon "*long undisturbed soil*" as a habitat that is irreplaceable, and as such shall be avoided under the step-wise approach. It is therefore incumbent upon the developer to assess the likelihood of long undisturbed soil to be present within the Site boundary.

At present, Aqua Terra is unaware of any published definition of long undisturbed soil to accompany this policy wording for the purposes of this report and in the absence of a definition in PPW, 'Long Undisturbed Soils' are considered to comprise soils that have remained undisturbed by human activity for a minimum of 100 years. Disturbance is considered to include but not be limited to the following activities and uses:

- Farming where this has involved ploughing, systematic change to vegetation communities, and any other evidenced mechanical or chemical soil modification

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

- Afforestation
- Building
- Excavation
- Reprofiling
- Livestock grazing where this has resulted in soil compaction, churning, poaching or exposure through vegetation removal.

The following indicators have been used to define areas where long undisturbed soils are likely to be absent:

- Fields or land parcels where aerial imagery, fieldwork observations or other evidence suggests ploughing has occurred in recent decades.
- Mapping undertaken as part of ecological assessment of the Site indicates that improved grassland is present, itself a likely indicator that ploughing has occurred in recent decades.
- Proximity to agricultural tracks suggests that cut/ fill has been undertaken in the formation of the track.
- Aerial imagery and/ or fieldwork observations indicate the presence of significant compaction/ poaching/ nutrient enriched associated with livestock, trafficking or other agricultural activity, including vegetation burning (noted on Site).

Using the above indicators and presence of peat deposits (removed as assessed separately), no areas where long undisturbed soils were noted under the footprint of the Proposed Development.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

3. Step-wise Approach to Development Design

In accordance with Chapter 6 of PPW, the infrastructure layout has evolved using the step-wise approach, seeking to avoid areas of peat soils and soil resources in the first instance. It is important to note that peat and soils were considered alongside a number of other environmental constraints. Many of these other constraints acted in concert with soils and peat in driving infrastructure layout, with further details provided in **ES Volume II**, **Chapter 3: Environmental Context and Reasonable Alternatives Considered**. However, there were also incompatibilities between constraints in some areas that needed to be balanced accordingly. The step-wise design evolution is summarised below:

3.1. Avoid

An initial peat survey (Stage 1) was undertaken across the Site using a 100 m grid density. This survey was used to define an initial draft layout which sought to avoid peat soils and valuable habitats where possible.

Once the draft layout had been agreed, further to input from the full EIA team, a Stage 2 peat survey was undertaken along trackways, turbine locations. Following this a targeted soil survey at 50 m grid spacing was undertaken across the Site. Phase 2 peat survey results, reviewed in April 2025, enabled more detailed avoidance, including relocating turbines and removing one turbine altogether where foundations and hardstanding would otherwise have resulted in unacceptable peat soil disturbance. Access tracks and site entrance options were also tested, with alignments through southern and upland areas discounted due to the presence of peat soils and challenging gradients. This step-wise refinement reduced the overall footprint on peat soils and ensured that sensitive ground conditions were systematically avoided during layout evolution.

3.2. Minimising Impacts Through Design

Where avoidance was not possible, the design process focused on minimising peat and soil disturbance through iterative refinement. This included adjusting turbine siting and ancillary infrastructure to reduce excavation volumes, selecting compound locations on flatter ground with lower peat depth, and optimising access track alignments to avoid saturated soils and limit cut-and-fill requirements. In the final design stage (April 2025), further measures were incorporated to reduce potential impacts, including relocation of the batching area away from watercourses, introduction of a temporary compound to support bridge construction with minimal peat loss, and modest reductions in turbine tip height to allow for more efficient track layouts. Locations for the temporary material/ soil storage areas (if required) were screened using the same step-wise approach. Selection of locations avoided areas of peat soil (where possible), significant slopes and siting within 50 m of watercourses.

Through this step-wise process, the final 10-turbine scheme achieves a balance between technical deliverability and the minimisation of peat disturbance, soil loss, and associated hydrological effects.

3.3. Minimising Impacts Through Construction

Through careful consideration of soil health and conservation, the impacts on soils can be minimised during the construction process, as set out in **Section 5**.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

3.4. Mitigate/ Restore

In addition to the implementation of construction methods to minimise the impact on soils, a series of construction-phase controls and protocols shall be employed to mitigate the impacts on soils and to deliver the successful restoration of soils at the end of the construction process. These are set out in **Section 6**.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

4. Soil Stripping Programme

4.1. Methodology

To ascertain the volume and type of soils that will need to be stripped during the construction phase, the development footprint was separated into the following types:

- **Earthworks**. This includes the earthwork batters either side of the infrastructure layout. It excludes the temporary and permanent infrastructure footprints themselves. Soils stripped from these areas will require storage for a short duration, with soil being restored upon completion of the earthworks. The volume stripped has been assumed to be the same as the volume restored, hence a neutral soil balance is to be achieved.
- **Temporary infrastructure**. This comprises the crane and lay down hardstands, batching plant, construction compound, temporary material/ soil storage areas (if required) and borrow pits. Soils stripped from these areas shall be restored upon completion of the construction programme and hence a neutral soil balance will be achieved. Soils from these areas shall require longer term storage than those associated with earthwork batters.
- **Permanent infrastructure**. This comprises permanent tracks and permanent hardstanding areas associated with turbines, substation and BESS. Soils stripped from these areas shall not be restored in-situ, and hence will require placement and restoration at an alternative location onsite.

A modelling exercise was undertaken to determine the volumes of soil that will need to be stripped. The proposed infrastructure layout was split into the three component types set out above, and further split into development aspect (e.g. temporary infrastructure; construction compound). Soil depth data was used to segment the infrastructure elements. The volume of soil in each segment was then calculated using the surface area multiplied by mean soil depth.

4.2. Soil Volumes and Types

The soil volumes calculated for each development segment are provided in **Table 4-2**. These segments were then compared with the soil types recorded at each of the soil/ peat probe locations and a soil type assigned to each segment. Where multiple soil types were consistently recorded across a segment, that segment has been listed as having a mixed soil type, using the following soil type categories (from Natural England Technical Information Note TIN037):

Table 4-1 Soil Types and Classifications

Soil Class	Typical Textures
Heavy soils	Clay loams, silty clays, heavy clays, peaty clay loams
Medium soils	Medium loams, sandy clay loams, silty clay loams
Sandy and light silty soils	Loamy sands, sandy loams, silty loams, coarse silts
Peaty soils	Organo-mineral soils, peaty-loam, peat <30 cm depth
Soil - Undifferentiated	Soils which have been proven to not be Peat via peat probing but which have not been classified via logging

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

The resultant soil type classification by infrastructure and earthworks segment is illustrated in **Figure 4-1** and **Figure 4-2**. It should be noted that in the areas where infrastructure was not accessible due to wind blow the soil type shown in these diagrams is the result of an interpolation, with the nearest available data point used to display the likely soil type under infrastructure.

Peat soils volumes where peat depth exceeds 30 cm have not been considered within this report as this falls within the scope of the Peat Management Plan (**ES Volume III, Appendix 7.4: Peat Management Plan**).

4.2.1. Soil Excavation and Re-use Volume Estimates

Soil excavation volumes were estimated from the proposed infrastructure designs as well as earthworks cut and fill plans, and depth contour maps. The resulting volumes are presented in **Table 4-2** and **Table 4-3** below.

Table 4-2 Topsoil Strip Volumes (m^3) by Soil Type and N/A Element

Infrastructure element	Topsoil class		Subtotal	Grand total
	Medium soils	Peaty and peat soils		
Batching compound	-	171	171	70,824
Batching compound earthworks (cut)	-	5	5

5. Minimising Impact on Soil During Construction

5.1. Assessing Soil Erodibility

The standard and techniques required to minimise and mitigate impact on soils is dependant to a degree on its erodibility as noted below.

5.1.1. Soils with Low Erosion Risk

These soils are generally more resistant to damage; standard control and management mitigation measures will provide appropriate protection.

5.1.2. Soils with Moderate Erosion Risk

If work is completed when conditions are ideal, standard control and management mitigation measures will provide appropriate protection. However, damage is likely to occur if soils are disturbed in unideal conditions such as when wet. Therefore, more careful consideration of the controls and mitigation implemented would be required.

5.1.3. Soils with High Erosion Risk

Development of these soils shall be avoided where possible. However, if work is completely necessary, special consideration shall be taken when planning the construction methods and extra mitigations shall be implemented in order to preserve the structure and function of the soils. Defra (2015)[7] use the metrics listed in **Table 5-1** to define erosion risk:

Table 5-1 Erosion Risk (after Defra 2015)

Factor	High risk	Medium risk	Low risk
Slope	Steep slopes >7° (12.3%)	Moderate slopes 3° to 7° (5.25 – 12.3%)	Low risk <3° (5.25%)
Proximity to waterbody	Directly adjacent to waterbody	At least one field between works are and waterbody	Distant from waterbody
Run-off history	Run-off or ponding seen in most years	Runoff seen in some years during wet periods/ most years during very wet periods	Runoff seen in some years during very wet periods

It shall be the responsibility of the Main Contractor to assess the erosion risk of each area of works using the above factors as a guide, as well as professional experience. The steepness of slopes is of particular importance in the protection of soils. The measures implemented by the Main Contractor shall then be designed based upon this assessment of erodibility.

[7] Defra, **2015**, Countryside Stewardship Runoff and soil erosion risk assessment. Countryside Stewardship Runoff and soil erosion risk assessment

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

5.2. Seasonal Working Constraints

A seasonal working constraint shall be considered during the preparation of the construction programme, particularly for works involving moving large amounts of soils. This restraint may not be project wide as it may not be achievable in reality, but instead must be considered on a case-by-case basis.

The works shall be planned when soils are not too wet or saturated wherever possible. The period lending to the driest soil conditions is typically the summer therefore the ideal time to complete operations involving soil handling is between May and September, however this may vary. It is noted that some hollows onsite or areas surrounding streams, specifically areas of peat soils, are likely to be more permanently wet. Therefore, if these soils are to be handled, location specific methods must be in place, as discussed in the Peat Management Plan in **ES Volume III, Appendix 7.4: Peat Management Plan**.

If placing the soils in temporary stockpiles, once this is complete, the soil moisture is of lesser importance. However, this is providing rainfall doesn't cause erosion of the soil, reducing the percentage of fines and altering the soil composition. This erosion can also have significant impacts on watercourses due to the influx of sediment.

5.3. Soil Conditions

Determining soil conditions accurately allows appropriate practise for soil handling to be determined. Methods for handling of mineral soils (e.g. clayey loam, stony soil) can be broadly split into two based on whether the soil is dry (Method 1) or wet (Method 2). Ideally all soil handling shall be conducted when the soil is dry to avoid unnecessary compaction and damage to soil structure however, when this is not achievable, method 2 for handling wet soils shall be implemented. For organic rich soils, following of Method 2 is most appropriate if soils must be handled.

Handling soils when wet comes with a higher risk of compaction, damaging the soil structure. When soil is wet it can be more easily compacted by machinery, and if placed in a stockpile, the weight of the soil above can compact the soils at the bottom of the stockpile. Furthermore, if placed in a stockpile when wet, the soil in the centre of the pile will remain wet and thus be very difficult to handle and re-spread. Therefore, soils shall always be handled dry where possible and if soil is wet when stockpiled, a period of drying and reparation will be required to ensure the soil is suitable for reinstatement.

5.3.1. Field Testing of Soil Conditions

The methodology outlined in **Table 5-2** and **Table 5-3** for assessing the condition of soils is considered adequate to inform which method for handling shall be used. The number of samples tested correlates with the extent of work to be undertaken, for example, a minimum of one sample per 50 m of linear features, or a minimum of two samples per Ha for compound and hardstand areas. Each 'sample' shall consist of at least five subsamples, and samples of topsoil and subsoil shall be tested separately. The final chosen method of handling will be based upon at least 80% of samples passing the tests for said method.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

Table 5-2 Testing for Soil Moisture

Test	Method of handling to be used
Soil sample is wet, films of water are visible on the surfaces of grains and aggregates; or Soil sample readily forms a cohesive 'ball' when squeezed.	Method 2 (wet soil)
Soil peds break up/crumble readily when squeezed. Sample does not form a cohesive ball.	Method 1 (dry soil)
Sample is moist and there is a slight dampness when squeezed but it does not significantly darken on further wetting.	If the consistency test for Method 1 (see below) is passed, Method 1 can be used with excavators – not dozers.
Sample is dry and brittle. Sample looks dry and darkens on wetting.	Apply consistency test below.

Table 5-3 Testing for Soil Consistency

Test	Method of handling soil
Step 1 – Attempt to roll sample into a ball by hand	
It is impossible because the soil is too hard (dry)	Method 1
It is impossible because the soil is too loose (dry)	Method 1
It is impossible because the soil is too loose (wet)	Method 2
It is possible to roll the sample into a ball by hand	See step 2 below
Step 2 – Attempt to roll the ball into a thread of 3mm diameter on a flat non-adhesive surface using light pressure from hand	
It is impossible as the soil crumbles or disintegrates	Method 1
It is possible to roll a 3 mm diameter thread	Method 2

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

5.4. Conditions for Ceasing of Soil Handling Activity

Certain weather conditions may lead to the cessation of soil handling to prevent damage. If the following criteria apply, soil handling must cease:

- Heavy rainfall is occurring.
- Sustained rainfall of more than 10 mm in 24 hours. In this case, soil handling must not be restarted until one full day of drying has been allowed or an agreed soil moisture content has been met. This soil moisture content will have been advised by or agreed upon by an appropriately qualified soil scientist.
- Immediately following heavy rainfall such that the soil is waterlogged or there are standing pools of water on the soil surface.
- Ground is frozen or covered by snow.

5.4.1. Exceptions

- If soil stripping is already underway prior to a weather event that requires cessation of activity, the work shall be completed to base level of topsoil/subsoil in the location before works are suspended.
- If the soil is organic rich, different stop conditions may be put in place.

Before recommencing work, the soil moisture content must be tested by the methods described in **Table 5-2** and **Table 5-3** to determine the appropriate soil handling method.

5.5. Minimising the Works Footprint

Areas where soil is to be removed, stockpile locations and haul routes shall be clearly defined prior to work commencing, and no trafficking of vehicles/ plants shall occur outside of these routes so as to minimise the extent of damage to soils.

Topsoil shall be stripped, stockpiled, handled and placed in the driest conditions possible (still giving consideration to risk of erosion by wind);

- Tracked vehicles and plants shall be used where possible to reduce compaction extent and intensity;
- No trafficking of plants or vehicles shall occur on reinstated soil;
- In the event that soils are wet or damp when being handled, excavators shall be used instead of dozers; and
- Daily records of operations undertaken and soil conditions shall be maintained during the period of soil handling.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

6. Mitigation

6.1. Soil Handling Principals

The main issues inhibiting successful restoration of soil resources revolve around incorrect handling and the trafficking of vehicles. The guidelines summarised below, as described in the Construction Code of Practice for the Sustainable Use of Soils on Construction Sites, Defra (2009)[8], shall be adhered to in order to minimise the risk of damage to soil resources during construction.

For specific guidelines and mitigation regarding the handling of peat soils, see the Peat Management Plan (**ES Volume III, Appendix 7.4: Peat Management Plan**).

The delivery mechanism for these mitigation measures will be via the Construction Environment Management Plan (CEMP). In consent conditions, measures included within the CEMP will not also be included in the final Soil Management Plan to avoid duplication and/or confusion.

6.2. Pre-Construction Site Preparation

Key tasks for sufficient preparation of a Site prior to construction are as follows:

- Clearance of vegetation. Through this ensuring that removal of vegetation is minimised to working areas and only for works that are essential. In order to minimise the risk of erosion and run-off, vegetation stripping shall be undertaken in segments, with only those areas to be worked on imminently stripped of vegetation. In this manner, vegetation stripping shall be undertaken in a staged sequence as the construction footprint progresses.
- Clear marking of areas where soil is to be removed, stockpiled and placed.
- Key signposting of areas that are to remain undisturbed during construction activities.
- Identification of areas requiring storage of multiple soil horizons and adequate signposting to prevent distinct horizons from mixing.
- Areas designated for stockpiling including temporary material/ soil storage area's shall be bare or mown/ strimmed such that surface vegetation is short. This is to reduce the likelihood of anaerobic conditions developing within stockpile.

6.3. Soil Stripping Technique

Applies to both Method 1 and Method 2 for dry or wet soils.

Soil stripping conducted during construction shall follow the guidance given in Defra's Construction Code of Practice for Sustainable Use of Soils in Construction Sites[9]. The key points to adhere to are as follows:

- Topsoil will be stripped separately prior to stripping the subsoil and progressively down to the base/formation layer.
- A back-acting excavator with a toothed-bucket shall be used for stripping in combination with dump trucks to transport stripped soil to stockpiles or area of reinstation.

[8] Defra, **2009**; 'Construction Code of Practice for the Sustainable Use of Soils on Construction Sites'. Available at: https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/707134/pb13298-code-of-practice-090910.pd

[9] Defra, **2009**; '*Construction Code of Practice for the Sustainable Use of Soils on Construction Sites'*. Available at: https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/707134/pb13298-code-of-practice-090910.pd

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

- Soil is stripped in the driest condition possible.
- Tracked equipment is used wherever possible.
- Topsoil must be stripped from any planned subsoil storage areas prior to the stripping of the subsoil.
- An appropriately sized earthmoving equipment shall be used for different sized work areas to be stripped.

Following this guidance will reduce compaction of soil during stripping and prevent loss of soil structure, maximising its readiness for re-use.

6.4. Stockpiles and Material/ Soil Storage Areas

Soil stockpiling shall be required during construction to enable storage and re-use of soils whilst limiting the damage caused by weather and construction activities, particularly following the stripping of the borrow pits.

6.4.1. Material Storage Areas

The five temporary material/ soil storage areas (if required) will be placed during the drier months, typically between May and September, so that handling of soil in wet conditions is minimised as well as compaction. Each area shall be sited, outside 50 m of watercourses or drains, and on ground with slopes no steeper than 1 in 2.

Topsoil and subsoil will be stripped and stored separately in low, stable stockpiles not more than 4 m high to prevent internal soil structural damage, with side slopes flatter than 1 in 2 to maintain stability. Stockpiles within the areas will be sealed and covered, or seeded if storage periods exceed three months, to prevent erosion and runoff. In soils that are wet or plastic, the material shall first be windrowed no higher than 2 m to promote aeration and drying. Drainage controls, comprising cut-off ditches and silt traps, should be established up and down-gradient of each material/ soil storage area, and no refuelling or chemical storage shall be allowed to take place within these areas. The temporary material soil storage areas will be inspected weekly and following every heavy rainfall event to ensure slope stability, adequate drainage performance, check for erosion and cover integrity. Where these conditions are not being met, any such deficiencies should be addressed promptly. Once removed, surfaces will be decompacted and soils reinstated in line with Sections 0 and 6.6.

6.4.2. General Stockpiles

Soils shall be segregated as excavated, such that each soil type present onsite is stockpiled separately (e.g. peaty soils shall be stockpiled separately to clayey loam). The following provides a list of general principles that shall be adhered to:

- Storage of soils shall be avoided wherever possible, direct movement from donor to receptor location shall be used in the first instance.
- Soil storage periods shall be kept as short as possible through overall good management of the Site.
- Vegetation and other waste materials shall be removed from planned storage areas prior to creating stockpiles.
- In order to protect stockpiles from erosion, they shall be seeded or covered until soil is removed and placed.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

- Stockpiles shall be clearly separated based on soil type (i.e. topsoil and subsoil) and origin location, and signposted based on their contents to prevent mixing of soils.
- Stockpiles must not be vulnerable to compaction or erosion.
- Stockpiles must not cause pollution to surrounding watercourses.
- Stockpiles must not increase local flood risk.
- Stockpiles must be clearly marked out and signed.
- Stockpiles shall generally not exceed 4 m for topsoil or 5 m for subsoil.
- Ecologically important soils must be stored separately from neighbouring soils.

There are two different methods for stockpiling based on the soil moisture and consistency, these are referred to in previous sections as Method 1 and Method 2.

Method 1 shall be used when soil is dry and in a non-plastic state. This allows a core of dry soil to be created, and along with appropriate protection of the soil from water during the storage period, this soil can be stored in this way on the scale of years.

Method 2 shall be used when the soil has to be stockpiled when wet and/or plastic in consistency. The aim is to minimise compaction and maximise surface area of the stockpile to allow the soil to dry out. Once the soil has dried, it can be heaped into stockpiles like in Method 1.

6.4.3. Stockpiling Method 1 – Dry or Non-plastic Soil (e.g. Stony Soil, Dry Clayey Loam)

Following the stripping of soil and its collection in a dumper truck, the soil is loose tipped in heaps, beginning from the furthest point into a storage area and working backwards towards the access point.

When the storage area has been filled with heaps, a tracked excavator will level the heaps and firm the surface in order for a second layer of heaps to be tipped on top.

This process is repeated until the stockpile reaches its planned height, with uniform gradients and a level surface to encourage water to run-off so that the soil remains dry.

The maximum gradient of a stockpiles sides depends on the texture and moisture content of the soil. The greatest achievable slope is 40 degrees (the natural angle of repose of soil) but to form stable stockpiles, a shallower slope angle is more appropriate. Defra recommends not steepening the slopes of a stockpile beyond 30 degrees in order to reduce the risk of erosion. Any stockpile kept for 3 months or more shall be seeded to reduce runoff, in this case, a maximum side slope of 25 degrees would be considered appropriate to allow maintenance.

6.4.4. Stockpiling Method 2 - Wet or Plastic Soils (e.g. Wet Clayey Loam, Organic Rich Soils)

Following the stripping of soil and its collection in a dumper truck, the soil shall be tipped in a line of heaps to form a 'windrow' beginning from the furthest point into a storage area and working backwards towards the access point. Additional windrows must be spaced apart such that a tracked plant can pass between them.

These heaps can be built up to a maximum height of 2 m. No machinery, tracked or un-tracked, can traverse the windrow in order to prevent compaction. Vehicles must only move between windrows in the allocated spaces.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

Once the soil has dried out sufficiently (a process that may require several weeks of dry and windy or warm weather) and has a non-plastic consistency, the windrows can be combined to form larger stockpiles. These larger stockpiles can be formed following the same steps as described for Method 1. To finish, the surface of the stockpile shall then be regraded and compacted to reduce infiltration of rainwater.

6.4.5. Protection and Maintenance of Stockpiles

Following the completion of the stockpile, the area shall be cordoned off and clearly signposted to prevent disturbance or contamination from other construction activities. The locations of each stockpile, approximate volumes and type of soil stored will be recorded on a Site plan.

It is anticipated that stockpiles shall fall into three broad categories, with each category being split into different stockpiles by soil type:

6.4.5.1. Short Term Earthworks Batter Stockpiles:

Where possible, the need to stockpile soils arising from earthworks batter areas shall be minimised by the synchronising of stripping (from newly excavated areas to start excavation of batters) and placement (in areas where the earthworks batter has been formed). Where physical or programme constraints prevent this, short-term stockpiles shall be required local to the excavation and re-use areas. Soils stockpiled in these areas are anticipated to remain in piles for less than 3 months.

6.4.5.2. Medium Term Temporary Infrastructure Areas

The nature of the construction method is such that there will be areas of the development footprint that require stripping of soils for the duration of the construction period in that particular area. Examples include the works compound and the temporary crane hardstands and lay-down areas at each turbine. In these areas, soils will need to be stockpile for longer periods, likely to be in excess of 6 months.

6.4.5.3. Long Term Stockpiling as Resource for Decommissioning

The soil stripped from the permanent track, turbine hardstand and substation footprints shall need to be stockpiled for the duration of the operational phase of the development, in order that it is available as a resource to enable re-soiling during decommissioning if required. These soils will be placed on the earthworks batters surrounding each infrastructure aspect, by locally thickening the soil profile in these areas. This will maintain the seedbank and soil type local to its origin. It will also minimise earth movements during both construction and decommissioning phases.

6.4.5.4. Stockpiling Protection

If stockpiles are to be stored for more than 6 months, the surface of the stockpile shall be seeded with a seed mix that matches the surrounding habitat. This is to minimise soil erosion, protect nutrient loss, maintain biological activity and reduce infestation of weeds or locally invasive species that could spread onto adjacent land. If seeding is to take place during a period of dry weather, the stockpiles shall be sprayed down with water in order to prevent wind erosion and aid the establishment of the seeds.

With the exception of that necessary to control Invasive Non-Native Species (INNS) under an appropriate INNS working method statement, use of herbicides shall be avoided to reduce potential impacts on local biodiversity.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

6.5. Reinstatement of Soil

The general aim is for most soil disturbed in the construction process to be reinstated to its original quality and land use. This can primarily be achieved by ensuring the soil is structured, uncompacted, well aerated and reinstated in the correct sequence of horizons. The potential end quality of the soil depends upon how well its structure is restored during placement; the following 'loose tipping' method described below is the most appropriate to use.

- Subsoil shall be decompacted prior to the placement of topsoil.
- The physical condition of the soil shall be assessed when placed to ensure the entire soil profile will promote sufficient aeration, drainage and growth.
- Anaerobic topsoil shall be fully aerated before commencing with any planting or seeding.
- Following construction and disturbance of soils, the soil health shall be closely monitored in a period of aftercare, with deficiencies being corrected as soon as they are detected.

During the excavation works, vigilance shall be maintained to identify ironpan horizons and to demarcate their presence. Where these remain extant (e.g. on the edge of excavated areas), the reinstatement of soils shall take account of the drainage impediment and potential for preferential flowpath creation that may occur where ironpans abut newly placed soil absent of ironpans.

6.5.1. Loose Tipping Method

When soil is not to be stored and moved directly to receiving area, an excavator with toothed bucket shall be used to load the soil materials onto a dump truck to the be transported. If soils are being stored in stockpiles, the dump track will enter the storage area by travelling on the base layer/subsoil. The toothed excavator may stand on top of the stockpile to load the dump truck, the stockpile will be dug to the base before moving back along its length.

The receiving subsoil or base layer shall first be decompacted and loosened, the recommendation is that this is achieved with winged subsoiler tines. This decompacting will only be effective if it is conducted when the moisture content of the soil is below the lower plastic limit so the soil will shatter and create fissures. This will reduce flood risk and promote deep root growth within the soil.

The dump truck carrying the soils will then be used to discharge the soils onto the decompacted receiving ground. An excavator, standing next to the dropped soil, will spread it out to the required thickness. If there are multiple horizons to be restored, the entire strip will be reinstated with subsoil before moving reinstating with topsoil by repetition of the process. The topsoil must be placed on the subsoil without the excavator tracking along the reinstated subsoil layer.

The quality of soil being reinstated will need to be verified by an appropriately qualified soil scientist. The quality required will depend on the land-use of the reinstated soil. This will be determined by carrying out a soil survey to record the physical characteristics of the reinstated soils and compare them against the pre -construction condition. If conditions vary greatly from the pre-construction conditions, remediation may need to be carried out in order to reach the reinstatement standard and commence to the aftercare period.

6.5.2. Reinstatement of Topsoil

The thickness of topsoil placement will depend on the pre-construction conditions and volume of topsoil retrieved for reinstatement in a certain location. Topsoil does not perform well below a depth of 400 mm bgl, soil thicknesses nearing this depth will only likely be required if the desired result involves bushes and trees with great rooting depths.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.

If topsoil has been stored in a stockpile it is likely compacted and anaerobic, thus appropriate tillage equipment will need to be used in order to decompact and re-aerate the soil when reinstating.

6.6. Aftercare

6.6.1. General Aftercare

Structurally weak soils may settle and self-compact following placement, resulting in waterlogging and anaerobic conditions in the soil. This will impact plant growth and contribute to erosion and flooding, therefore maintaining soil permeability is a vital part of aftercare.

Maintenance shall include monitoring of soil to identify any unsatisfactory conditions, which shall be achieved by taking augers of representative locations across the Site 2-3 times a year. This shall begin more frequently, particularly the first few weeks following reinstatement, and then decline to a few times per year.

The requirement for additional aftercare interventions shall be assessed by the Main Contractor. Such interventions may include cultivation (subsoiling etc.), underdrainage installation or blocking of preferential drainage pathways or seeding. These remediation treatments will depend on the habitat that is to be achieved following reinstatement.

Defra guidance suggests aftercare between 1 and 5 years after construction. The aftercare period for the Proposed Development will be for the lifetime and duration of the scheme, hence significantly exceeding these guidelines.

6.6.2. Borrow Pit Restoration

The soils stripped from the borrow pit shall be stored within the borrow pit search area for the duration of the working of the borrow pit, and then used to restore the borrow pit. These soils shall be stored and handled according to the same protocols as that set out for all site soils in this document.

Registered in England and Wales with Company No. 15820480 at 14 Museum Place, 4th Floor, Cardiff, Wales, CF10 3BH.
